Budget-team feasibility report

Replay-conditioned survival and damage screens for the Brain in a Vat encounter. Prepared from the saved replay; no account play or desktop control was used.

VERDICT	One testable team; no verified minimum-cost or no-death clear. The current model cannot yet execute this team's card sequence, Wheels, Keyflare/Posse, or exact output.

Candidate and investment

Slot	Reason
Mouchette E3	Area damage to boss and summons; post-Exalt Mortal Blast can gain a third hit.
Lotan E7	One 15%-of-target-max-HP pure hit to all enemies from the E7 effect, when its action is legal.
Doll E2	Healing and all-enemy Weakness; E2 improves her other recovery/Block effect.
Ogier E0	Baseline Defend and Rampart cards supply Block; their actual output is uncalculated.

All four are Chaos members, matching the listed starting Chaos Ring. No Wheel, Soulforge, equipment, level, skill level, or owned roster state is assumed.

What the replay establishes

The submitted clear took **16 rounds and two deaths/respawns**. It spawned 27 adds and recorded **17,053 incoming damage before Block**. Equivalent Exchange occurred four times: the player's maximum HP fell 3,141 to 2,513 to 2,011 to 1,609 to 1,288, while the boss's maximum HP grew. The two listed starting bars total **8,014,887 HP**, but the boss's second-bar maximum reached 11,079,782 by turn 14.

Survival stress test

We replayed the recorded enemy hits in order from 3,141 starting HP, applied the observed maximum-HP reductions, and disallowed death. The table shows the **minimum fresh Block every turn** needed with fixed healing at turn start. Unused Block expires; healing cannot exceed current maximum HP.

Survive through	0 heal	250 heal	500 heal
Turn 4	0	0	0
Turn 8	614	338	138
Turn 11	1,077	740	646
Turn 16	1,344	1,062	812

For example, 500 effective healing plus 646 fresh Block each turn passes this recorded-hit test through turn 11. This does **not** mean Doll and Ogier produce those amounts with this build or draw them on time.

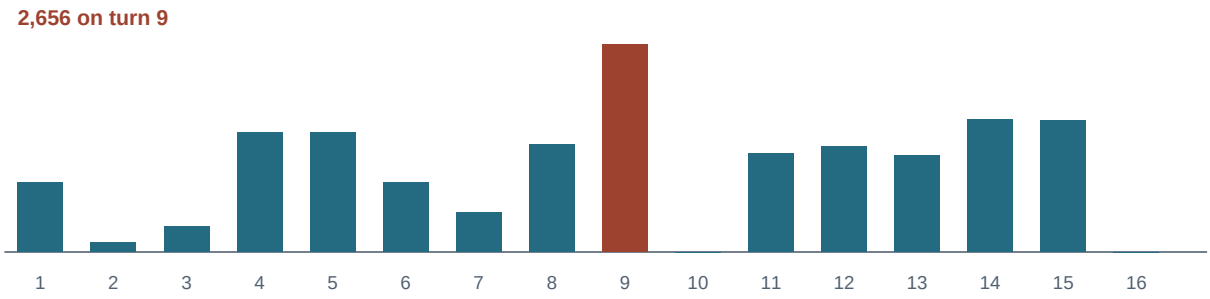
Damage and add-clear gates

Without HP growth or add damage, the two bars alone require about **1.00M damage per turn** by turn 8, or **729k per turn** by turn 11. These are necessary averages, not predicted DPS. Lotan's E7 coefficient corresponds to about 400,744 raw HP on the first boss bar and 801,489 on the unmodified second bar, only if that action is charged and resolves.

The first observed add had 58,776 HP. One Lotan 15% hit is about 8,816, leaving about 49,960. After Mouchette's first E3 Exalt, a three-hit Mortal Blast would need at least **16,654 actual HP damage per hit** to finish that add alone. A historical Mouchette Blast in another stage dealt only 13,815 *total* damage to each small enemy. That comparison does not predict this build, but it makes add clearing the main unresolved risk.

Recorded enemy pressure by turn

Incoming damage before Block from the submitted replay; turn 9 is the largest observed spike. These values are conditional on that run's enemy states and add survival.



Why this is a screen, not a battle simulation

The replay's incoming hits already include its own enemy states; applying Doll's Weakness again would double-count mitigation. A different team changes kill timing and enemy actions. We have not resolved actual build stats, card draws, Compute, Aliemus, Keyflare/Posse, Wheel triggers, healing or Block output. We therefore cannot certify survival, mobbing, a boss kill, or minimum investment.

Next verification gate

Freeze one actual Lv70/90 loadout and Wheel set; calculate its turn-by-turn healing, Block, and damage; show add deaths before attacks and both boss bars before repeated Equivalent Exchange; then compare an independent no-death replay. Do not spend account resources on this hypothesis alone.
